The Top Products and Technology Stories of 2015

Thermal management, color tuning, remote phosphors, and more trends that shaped the industry last year.

By [Hallie Busta](#)

If the amount of research and development currently underway in the lighting sector is any indication, the industry is continuing its recovery from the recession loaded with innovation. This year, we explored trends ranging from improved thermal management in luminaires to material innovations that integrate the light source with other building components, as well as our annual look at product development across the industry. See below for our top products and technology stories of 2015.

“Color Tunability Joins Manufacturers' Product Offering” (From May/June 2015)

New luminaires make use of solid-state lighting's color-tuning capabilities, giving specifiers more control over how they light a space and suggesting a future where such functionality is the norm.
